Macklis J.D., Kwiatkowski D., Soriano P., Gertler F.B.;
"Mena is required for neurulation and commissure formation.";
Neuron 22:131-325(1999).
-!- FUNCTION: May be involved in microfilament assembly and cell
motility. Induces the formation of F-actin rich outgrowths in
fibroblasts. Required for neurulation and commissure formation.
-!- SUBGNIT: Binds profilin.
-!- SUBGRILUIAR LOCATION: Localized to focal adhesions and, to a
lesser extent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Name=3; Synonyms=Mena+;

"A Drosophila photoreceptor cell-specific protein, calphotin, binds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          calcium and contains a leucine zipper.";
Proc. Natl. Acad. Sci. U.S.A. 90:1536-1540(1993).
-!- FUNCTION: Might function as a calcium-sequestering "sponge" to regulate the amount of free cytoplasmic calcium. It binds 0.3 m of Ca(2+) per mole of protein.
-!- SUBUNIT: Homodimer (Probable).
Indels 122;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  DEVELOPMENTAL STAGE: Expressed early in photoreceptor cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SUBCELLULAR LOCATION: Cytoplasmic; hypodense compartment. "Werture Tailoland Stokul,"

"Hyperpolarization-activated ion channel with very slow activation and inactivation exhibiting weak selectivity for activation and inactivation exhibiting weak selectivity for potassium over sodium ions. May contribute to the native pacemaker currents in heart (If) and in neurons (Ih). Activated by CAMP. May mediate responses to sour stimuli.

"SUBMIT: The potassium channel is probably composed of a homo- or heterotetrameric complex of pore-forming subunits.

"ISSUB SPECIFICITY: Highly expressed in pyramidal and granule layer of the hippocampus, in thatamus anterior nucleus, in the supraoptic nucleus in hypothalamus, in cerebellum, and in trapezoid nuclei and superior olivary complex in the auditory system. Detected in a subset of elongated cells in taste buds.

"Issubmantant a segment 34 is probably the voltage sensor and is characterized by a series of positively charged amino acids at every third position."

"Hand Defended in a series of positively charged amino acids at every third position."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This SWISS-PROT entry is copyright. Patent No. 6638518
GENERAL INFORMATION:
GENERAL INTORMATION:
APPLICANT: Rathiff, Timothy
APPLICANT: Kline, Joel
TITLE OF INVENTION: METHOD FOR INHIBITING INFLAMMATORY RESPONSES
FILE REPERRING: 140.0010 0101
CURRENT APPLICATION UNDER: US/09/510,031A
CURRENT FILING DATE: 2000-02-22
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 .

Publication No. US20030054008A1

GENERAL INFORMATION:

APPLICANT: LAQUENTERIE, Anne
APPLICANT: LAQUENTERIE, Anne
APPLICANT: PESCHER, Pascale
APPLICANT: PESCHER, Pascale
APPLICANT: ROMAIN, Felix
ITLE OF INVENTION: MYCOBACTERIAL PROTEINS, MICORORGANISMS PRODUCING THEM
ITLE OF INVENTION: WYCOBACTERIAL PROTEINS, MICORORGANISMS PRODUCING THEM
ITLE OF INVENTION: WYCOBACTERIAL PROTEINS, AND FOR THE DETECTION OF
ITLE OF INVENTION: UNMERR: US/09/985,372

CURRENT FILING DATE: 2001-11-02
PRIOR APPLICATION NUMBER: EARLIER FILING DATE: 1998-08-11
